

A Breakthrough in **PSORIASIS TREATMENT**: **BIOPTRON®** HYPERLIGHT THERAPY

ARE YOU SEEKING A MORE EFFECTIVE WAY TO **MANAGE** **PSORIASIS?**

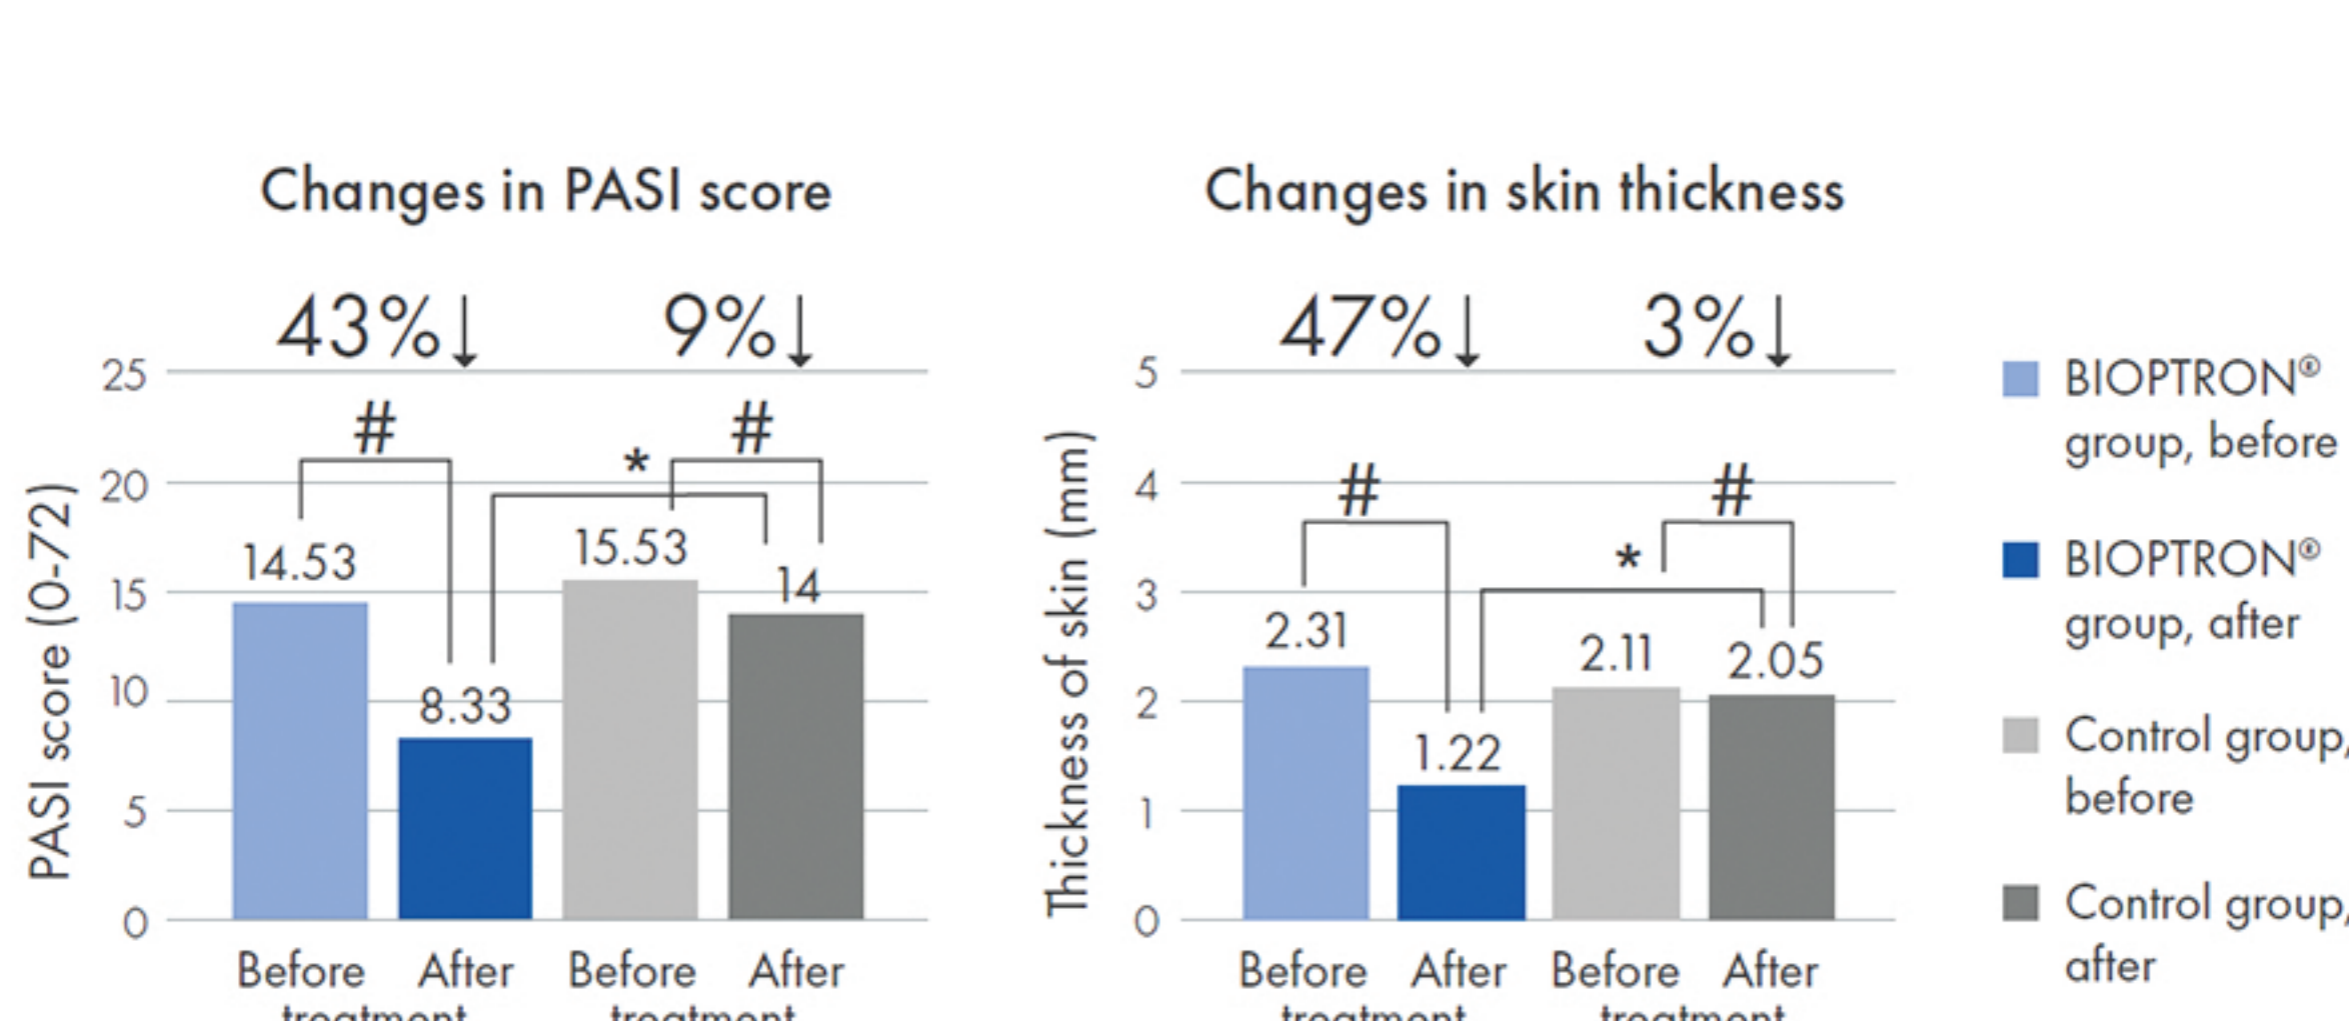

A recent clinical study
highlights a powerful new
approach – **BIOPTRON®**
Hyperlight Therapy.

This innovative, non-invasive therapy uses a scientifically recognized process called **photo-biomodulation** to stimulate your body's natural repair mechanisms at a cellular level. It's a drug-free solution that targets the root of the problem without side effects.

What the Study Found:

In a randomized clinical trial, patients who combined **Bioptron® Hyperlight Therapy** with a standard topical cream saw dramatically better results than those who used the cream alone.

PASI (Psoriasis Area and severity index, used to measure how severe the psoriasis is) and skin thickness scores before and after treatment in control group and group treated with **BIOPTRON®**. **PASI** and skin thickness decreased in both groups (# $p < 0.05$ before vs after treatment), but the improvement was significantly much better in **BIOPTRON** group (* $p < 0.001$).

UP TO 47% REDUCTION IN SYMPTOMS:

Patients saw a significant decrease in lesion severity, redness, thickness, and scaling in **just 4 weeks**.

- **VISIBLE IMPROVEMENT IN DAYS:**
Noticeable improvements in skin appearance were observed as early as the **first few sessions**.

LONG-LASTING RESULTS:

The benefits continued even after the therapy cycle ended, there was no recurrence or aggravation of skin lesions.

- **POTENTIAL TO REDUCE MEDICATION:**
Some patients were even able to reduce current treatments.

BIOPTRON® Hyperlight Therapy provides a safe, effective, and scientifically proven way to manage plaque psoriasis.

WE INVITE YOU TO DISCOVER HOW THIS THERAPY COULD BE A PART OF YOUR DERMATOLOGICAL CARE.
